DuraLiner Geotextile Fabric

Proper surfacing is an integral part of any play area: Almost 80% of injuries sustained at playgrounds are caused by falls from structures such as swings and climbing bars. The best way to reduce the severity of playground falls is to make sure the play area is covered with a durable surface designed to absorb impact. But when using surfacing materials such as wood, it's important to consider proper drainage to extend the life of the material, and that's where DuraLiner fabric comes in.

DuraLiner geotextile fabric works in conjunction with our engineered wood fiber to create a playground surface unlike those of any other commercial brands. This geotextile drainage fabric is designed to protect the wood fiber from excessive water damage that comes with heavy storms. Zeager Bros. engineered DuraLiner to be permeable so that water can drain away from your play area. DuraLiner extends the life of your playground surface, and the geotextile cloth also prevents weeds and other seedlings from taking root in loose-packed materials, adding longevity to the wood fiber. Invest in DuraLiner fabric along with engineered wood fiber to help kids stay safe on the playground!

The DuraLiner geotextile fabric for sale here helps create a playground surface that can withstand and protect wood fiber from the elements after proper installation. This special material is cost-effective and easy to install. The most effective installation uses two layers of DuraLiner with three inches of crushed stone in between the cloth matting.
